When doing the cross regulation test (one output channel at high load and the other output channels at low load), it is requested to set the higher output channel at 80% max. of its spec., and the lower output channels at 20% max. of theirs.

3.2 Regulation

3.3.2 Ripple voltage test circuit

0.1µf is ceramic, the other is tantalum.

Noise bandwidth is from DC to 20Mhz

3.4 Overshoot

Any overshoot at turn on or turn off shall be less than 15% of the nominal voltage value, all output shall be within the regulation limit of section 3.1 before issuing the power good signal of section 6.0.

3.5 Efficiency

Power supply efficiency typical 65% at 115V, full load.

3.6 Remote on/off control

The power supply DC outputs (with the exception of +5VSB) shall be enabled with an active-low, TTL-compatible signal (“ PS-ON ”)

When PS-ON is pulled to TTL low, the DC outputs are to be enabled.

When PS-ON is pulled to TTL high or open circuited, the DC outputs are to be disabled.

4.0 Protection

4.1 Input (primary)

The input power line must have an over power protection device in accordance with safety requirement of section 8.0

4.2 Output (secondary)

4.2.1 Over power protection

Over power protection at 110%~160% of rated output power .The power supply latches all DC output into a shutdown state. Over power of this type shall cause no damage to power supply, after over power is removed and a power on/off cycle is initiated, the power supply will restart.

4.2.2 Over voltage protection

If an over voltage fault occurs (internal of the power supply), the power supply will latch all DC output into a shutdown state before

+5V : 5.7V ~ 6.5V

+3.3V : 3.7V ~ 4.1V

+12V : 13.2V ~ 14.5V

4.2.3 Short circuit

A: A short circuit placed on any DC output to DC return shall cause no damage.

B: The power supply shall be latched in case any short circuit is taken place at +5V, +3.3V, +12V output.

C: The power supply shall be auto-recovered in case any short circuit is taken place at -5V, -12V, +5VSB.

5.0 Power supply sequencing

5.1 Power on (see fig.1)

5.2 Hold up time

When power shutdown DC output 5V must be maintain 16msec in regulation limit at normal input voltage.

5.3 Power off sequence (see fig. 1)

6.0 Signal requirements

6.1 Power good signal (see fig. 1)

The power supply shall provide a "power good" signal to reset system logic, indicate proper operation of the power supply, and give advance warning of impending loss of regulation at turn off. This signal shall be a TTL compatible up level (2.4V to 5.25V) when +5V output voltage are present and above the minimum UV sense levels specified in paragraph 6.2, or a down level (0.0V to 0.8V) when any output is below its minimum UV sense level.

At power on, the power good signal shall have a turn on delay of at least 100ms but not greater than 500ms after the output voltages have reached their respective minimum sense levels.
