

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:1 of 21

1 GENERAL SCOPE

This specification defines the performance characteristics of a grounded, AC input, 500 watts, 2 outputs power supply. This specification also defines worldwide safety requirements and manufactures process test requirements.

2 Power Input Specification

2.1 Input Voltage

The power supply must operate within all specified limits over the following input voltage range. The power supply shall operate properly at 85 VAC input voltage to guarantee proper design margins.

PARAMETER	MIN	RATED	MAX	PEAK
Voltage (110)	90 Vrms	100 – 127 Vrms	140 Vrms	
Current	7A Max.			
Voltage (220)	180 Vrms	200 – 240 Vrms	264 Vrms	
Current	3.5A Max.			
Frequency	47 Hz	50 – 60 Hz	63 Hz	

2.2 AC Inrush Current

AC line inrush current shall not exceed 30A peak, for up to one-quarter of the AC cycle, after which, the input current should be no more than the specified maximum input current. The peak inrush current shall be less than the ratings of its critical components (including input fuse, bulk rectifiers, and surge limiting device).

The power supply must meet the inrush requirements for any rated AC voltage, during turn on at any phase of AC voltage, during a single cycle AC dropout condition as well as upon recovery after AC dropout of any duration, and over the specified temperature range (Top).

2.3 Efficiency, Power Factor Correction and iTHD

Load(%)	115Vac 60Hz			230Vac 50Hz		
	Max. iTHD (%)	Min. Power Factor	Min. Efficiency (%)	Max. iTHD (%)	Min. Power Factor	Min. Efficiency (%)
20%	10	0.95		10	0.95	90
50%	8	0.95		8	0.95	94
100%	5	0.95		5	0.95	91

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:2 of 21

2.4 AC Line Dropout / Holdup

An AC line dropout is defined to be when the AC input drops to 0VAC at any phase of the AC line for any length of time. During an AC dropout the power supply must meet dynamic voltage regulation requirements. An AC line dropout of any duration shall not cause tripping of control signals or protection circuits. If the AC dropout lasts longer than the holdup time the power supply should recover and meet all turn on requirements. The power supply shall meet the AC dropout requirement over rated AC voltages and frequencies. A dropout of the AC line for any duration shall not cause damage to the power supply.

Loading	Holdup Time
100%	10ms

2.5 Susceptibility Requirements

The power supply shall meet the following electrical immunity requirements when connected to a cage with an external EMI filter, which meets the criteria defined in the SSI document EPS Power Supply Specification.

Level	Description
A	The apparatus shall continue to operate as intended. No degradation of performance.
B	The apparatus shall continue to operate as intended. No degradation of performance beyond spec. limits.
C	Temporary loss of function is allowed provided the function is self-recoverable or can be restored by the operation of the controls.

2.5.1 Electrical Discharge Susceptibility

The power supply shall comply with the limits defined in EN 55024:1998 using the IEC 61000-4-2:1995 test standard and performance criteria B defined in Annex B of CISPR 24.

2.5.2 Fast Transient/Burst

The power supply shall comply with the limits defined in EN55024:1998 using the IEC 61000-4-4:1995 test standard and performance criteria B define in Annex B of CISPR 24.

2.5.3 Radiated Immunity

The power supply shall comply with the limits defined in EN55024:1998 using the IEC61000-4-3:1995 test standard and performance criteria A defined in Annex B of CISPR 24.

2.5.4 Surge Immunity

The power supply shall be tested with the system for immunity to AC Ring wave and AC

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:3 of 21

Unidirectional wave, both up to 2kV(Differential mode 2K,Common mode 1K), per EN55024:1998, EN 61000-4-5:1995 and ANSI C62.45:1992.

The pass criteria include: No unsafe operation is allowed under any condition; all power supply output voltage levels to stay within proper spec levels; No change in operating state or loss of data during and after the test profile; No component damage under any condition.

The power supply shall comply with the limits defined in EN55024:1998 using the IEC 61000-4-5:1995 test standard and performance criteria B defined in Annex B f CISPR 24.

2.5.5 AC Line Transient Specification

AC line transient conditions shall be defined as “sag” and “surge” conditions. “Sag” conditions are also commonly referred to as “brownout”, these conditions will be defined as the AC line voltage dropping below nominal voltage conditions. “Surge” will be defined to refer to conditions when the AC line voltage rises above nominal voltage.

The power supply shall meet the requirements under the following AC line sag and surge conditions.

AC Line Sag Transient Performance (10sec interval between each sagging):

Duration	Sag	Operating AC Voltage	Line Frequency	Performance Criteria
0 to 1/2 AC cycle	95%	Nominal AC Voltage ranges	50/60Hz	No loss of function or performance
>1 AC cycle	>30%	Nominal AC Voltage ranges	50/60Hz	Loss of function acceptable, self recoverable

AC Line Surge Transient Performance

Duration	Surge	Operating AC Voltage	Line	Performance Criteria
Continuous	10%	Nominal AC Voltage ranges	50/60Hz	No loss of function or performance
0 to 1/2 AC cycle	30%	Mid-point of nominal AC Voltages	50/60Hz	No loss of function or performance

2.5.6 AC Line Fast Transient (EFT) Specification

The power supply shall meet the EN61000-4-5 directive and any additional requirements in IEC1000-4-5:1995 and the level 3 requirements for surge-withstand capability, with the following conditions and exceptions:

- These input transients must not cause any out-of-regulation conditions, such as overshoot and undershoot, nor must it cause any nuisance trips of any of the power supply protection circuits.
- The surge-withstand test must not produce damage to the power supply.

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:4 of 21

- The supply must meet surge-withstand test conditions under maximum and minimum DC-output load conditions.

2.5.7 Power Recovery

The power supply shall recover automatically (auto recover) after an AC power failure. AC power failure is defined to be any loss of AC power that exceeds the dropout criteria.

2.5.8 Voltage Brownout

Input voltage range for AC minimum startup voltage, 81 to 89VAC, and maximum turn off voltage range 71 to 79VAC

2.5.9 AC Line Leakage Current

The maximum leakage current to ground of power supply shall be 0.875mA when tested at 264Vac/60Hz.

3 Power Output Specification

3.1 Grounding

The output ground of the pins of the power supply provides the output power return path. The ground output at the PCB card edge shall be connected to the safety ground (power supply enclosure). This grounding should be well designed to ensure passing the max allowed Common Mode Noise levels.

The power supply shall be provided with a reliable protective earth ground. All secondary circuits shall be connected to protective earth ground. Resistance of the ground returns to chassis shall not exceed 100 mΩ (Test Conditions 40A for 120sec). This path may be used to carry DC-current

3.2 Output Rating

GROUP	1	2
OUTPUT VOLTAGE	+12V	+5VSB
RATED LOAD	40.4A	3A
MAX. LOAD	41A	3.5A
PEAK LOAD	49A	4.0A
MIN. LOAD	0A	0A
REGULATION	±5%	±5%
RIPPLE & NOISE (mV)	120	50
Capacitive Loads (uF)	12000	350

NOTE:

- The continuous maximum total output power shall not exceed 500W.

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:5 of 21

- Peak power and current loading should be supported for a minimum of 100ms.
- The power supply shall meet the voltage regulation under all operating conditions (AC line, transient loading, output loading). These limits include the peak-peak ripple/noise.
- Ripple and Noise measuring with an oscilloscope with 20 MHz bandwidth. Output should be bypassed at the connector with a 0.1uF ceramic disk capacitor and a 10uF electrolytic capacitor to simulate system load. The length of ground wire on probe should not longer than 40mm, if a Non - differential type of scope was used.

3.3 No Load Operation

The power supply shall meet all requirements except for the transient loading requirements when operated at no load on all outputs.

3.4 Dynamic Loading

The output voltages will remain within limits specified in 3.2 Output Voltage Regulation for the step loading and capacitive loading specified in the table below. The load transient repetition rate shall be tested between 50Hz and 5kHz at duty cycles ranging from 10%-90%. The load transient repetition rate is only a test specification. The Δ step load may occur anywhere within the MIN load to the MAX load conditions.

Output	Δ Step Load Size	Load Slew Rate	Test capacitive Load
+12V	60% of max load	0.5A/ μ s	2000uF
+5VSB	1.0A	0.5A/ μ s	20uF

Note: For dynamic condition +12V min loading is 1A.

3.5 Maximum Load Change

The power supply shall continue to operate normally when there is a step change $\leq 1A/\mu$ sec, between minimum load and maximum load.

3.6 Close loop Stability

The power supply shall be unconditionally stable under all line/load/transient load conditions including capacitive load ranges. A minimum of: 45 degrees phase margin and -10dB gain margin is required.

Closed-loop stability must be ensured at the maximum and minimum loads as applicable.

3.7 Residual Voltage Immunity in Standby mode

The power supply should be immune to any residual voltage placed on its outputs (Typically a leakage voltage through the system from standby output) up to 500mV. There shall be no additional

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:6 of 21

heat generated, nor stressing of any internal components with this voltage applied to any individual or all outputs simultaneously. It also should not trip the protection circuits during turn on.

The residual voltage at the power supply outputs for no load condition shall not exceed 100mV when AC voltage is applied and the PSON# signal is de-asserted.

3.8 Soft Starting

The Power Supply shall contain control circuit which provides monotonic soft start for its outputs without overstress of the AC line or any power supply components at any specified AC line or load conditions.

3.9 Forced Load Sharing

The +12V output will have active load sharing. The output will share within 10% at full load. The failure of a power supply should not affect the load sharing or output voltages of the other supplies still operating. The supplies must be able to load share in parallel and operate in a hot-swap / redundant 1+1 configurations.

Ishare Voltage	
% of max. current capacity	Voltage level (+/- 10%)
50%	4V
100%	8V

3.10 Over shoot at Turn-on/Turn-off

Any output overshoot at turn on shall be less than 10% of the nominal output value. Any overshoot shall recover to be within regulation requirements in less than 10ms.

3.11 Undershoot at Turn-on/Turn-off

Any output shall not undershoot at turn on or off cycle under any circumstances.

4 Timing

The output voltages rise from 10% to within regulation limits (Tvout_rise) within 5 to 70ms. For +5VSB, it rises from 1 to 25ms. All outputs rise monotonically. Table below shows the timing for the power supply being turned on and off via the AC input, with PSON held low and the PSON signal, with the AC input applied.

Item	Description	MIN	MAX	Units
Tvout_rise	Output voltage rise time	5.0	70	ms
Tsb_on_delay	Delay from AC being applied to +5VSB being within regulation.		1500	ms

SWITCHING POWER SUPPLY

Page:7 of 21

T ac_on_delay	Delay from AC being applied to all output voltages being within regulation.		3000	ms
Tvout_holdup	Time 12V output voltage stay within regulation after loss of AC	11		ms
Tpwok_holdup	Delay from loss of AC to de-assertion of PWOK	10		ms
Tpson_on_delay	Delay from PSON# active to output voltages within regulation limits.	5	400	ms
T psion_pwok	Delay from PSON# deactivate to PWOK being de-asserted.		50	ms
Tpwok_on	Delay from output voltages within regulation limits to PWOK asserted at turn on.	100	500	ms
T pwok_off	Delay from PWOK de-asserted to output voltages dropping out of regulation limits.	1		ms
Tpwok_low	Duration of PWOK being in the de-asserted state during an off/on cycle using AC or the PSON# signal.	100		ms
Tsb_vout	Delay from +5VSB being in regulation to O/Ps being in regulation at AC turn on.	50	1000	ms
T5Vsb_holdup	Time +5VSB output voltage stays within regulation after loss of AC	70		ms

Turn on/off Timing

5 Control And Indicator Functions

5.1 PSON# Input Signal

The PSON# signal is required to remotely turn on/off the power supply. PSON# is an active low signal that turns on the main output power rail. When this signal is not pulled low by the system, or left open, the outputs (except the standby output) turn off. This signal is pulled to a standby voltage by a pull-up resistor internal to the power supply.

Signal Type	Accepts an open collector/drain input from the system. Pull-up to VSB located in power supply.	
PSON# = Low	ON	
PSON# = High or Open	OFF	
	MIN	MAX
Logic level low (power supply ON)	0V	1.0V
Logic level high (power supply OFF)	2.0V	3.46V
Source current, $V_{pson} = \text{low}$		4mA
Power up delay: $T_{pson_on_delay}$	5ms	400ms
PWOK delay: T_{pson_pwok}		50ms

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:9 of 21

5.2 PWOK (Power OK) Output Signal

PWOK is a power OK signal and will be pulled HIGH by the power supply to indicate that all the outputs are within the regulation limits of the power supply. When any output voltage falls below regulation limits or when AC power has been removed for a time sufficiently long so that power supply operation is no longer guaranteed, PWOK will be de-asserted to a LOW state. The start of the PWOK delay time shall inhibited as long as any power supply output is in current limit.

Signal Type	Open collector/drain output from power supply. Pull-up to VSB located in the power supply.	
PWOK = High	Power OK	
PWOK = Low	Power Not OK	
	MIN	MAX
Logic level low voltage, Isink=400uA	0V	1.0V
Logic level high voltage	2.0V	3.46V
Sink current, PWOK = low		400μA
Source current, PWOK = high		2mA
PWOK delay: Tpwok_on	100ms	500ms
PWOK rise and fall time		100μs
Power down delay: Tpwok_off	1ms	

5.3 SMBAlert# SIGNAL

This signal indicates that the power supply is experiencing a problem that the user should investigate. This shall be asserted due to Critical events or Warning events. The signal shall activate in the case of critical component temperature reached a warning threshold, general failure, over-current, over-voltage, under-voltage, failed fan. This signal may also indicate the power supply is reaching its end of life or is operating in an environment exceeding the specified limits.

This signal is to be asserted in parallel with LED turning solid Amber or blink Amber.

Signal Type (Active Low)	Open collector / drain output from power supply. Pull-up to VSB located in system.	
Alert# = High	OK	
Alert# = Low	Power Alert to system	
	MIN	MAX
Logic level low voltage, Isink=4mA	0V	1.0V
Logic level high voltage, Isink=50μA	2.0V	3.46V
Sink current, Alert# = low		4mA
Sink current, Alert# = high		50μA
Alert# rise and fall time		100μs

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:10 of 21

5.3.1 A0

PSU Module Address Line 0. This signal line is provided for determining the address for the specific PSU FRU and SMBus address. The pull-up resistor should be located in the system and the pull-up voltage should be limited to 3.3V.

The address line should be pull low with equal to or less than 100ohm in the motherboard design.

5.3.2 A1

PSU Module Address Line 1. This signal line is provided for determining the address for the specific PSU FRU and SMBus address. The pull-up resistor should be located in the system and the pull-up voltage should be limited to 3.3V.

The address line should be pull low with equal to or less than 100ohm in the motherboard design.

5.4 SDA and SCL

One pin is the serial clock (SCL), and the other pin is used for serial data (SDA). The SCL and SDA signals are pulled up by system, both pins are bi-directional, open drain signals, and are used to form a serial bus.

5.5 PSKILL Signal (Pin# S7)

The purpose of the PSKILL pin is to allow for hot swapping of the power supply. The PSKILL pin on the power supply is shorter than the other signal pins. When a power supply is operating in parallel with other power supplies and then extracted from the system, the PSKILL pin will quickly turn off the main output to prevent arcing of the DC output contacts. T_{PSKILL} is the minimum time delay from the PSKILL pin un-mating to when the power pins un-mate. The power supply must discharge its output inductor within this time from the un-mating of PSKILL pin. When the PSKILL signal pin is not pulled down or left open (power supply is extracting from the system or had not been inserted to the system), the power supply should shut down regardless of the condition of the PSON[#] signal.

The mating pin of this signal in the system shall be tied to ground. Internal to the power supply, the PSKILL pin shall be connected to a standby voltage through a pull-up resistor. Upon receiving a LOW state signal at the PSKILL pin, a PSON[#] signal shall enable the power supply to turn on.

Signal Type (Input Signal to Supply)	Accepts a ground input from the system. Pull- up to Vsb located in the power supply.
PSKILL = Low, PSON [#] = Low	ON
PSKILL = Low or Open, PSON [#] = Open	OFF
PSKILL = Open , PSON [#] = Low	OFF

	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019
SWITCHING POWER SUPPLY		Page:11 of 21

	MIN	MAX
Logic level low (power supply ON)	0V	1.0V
Logic level high (power supply OFF)	2.0V	3.46V
Source current, $V_{PSKILL} = \text{low}$		2.8mA
Delay from PSKILL=High to power supply turned off (T_{PSKILL})		100 μ sec

5.6 PRESENT Signal (Pin# S14)

This signal pin is recessed within the connector and will contact only once all other connector contacts are closed. This active-low pin is used to indicate to a power distribution unit controller that a supply is plugged in. the maximum current on Present# pin should not exceed 10mA.

5.7 INPUT OK Signal (Pin# S19)

INPUT OK is an AC/HVDC OK signal and will be pulled up by the power supply to indicate that AC/HVDC input is within the operation range. The INPUT OK signal shall pull Lo < 2msec after input voltage is lost to 0V; after 4 AC cycles if the input voltage resume within operation range then INPUT OK signal shall pull High.

Signal Type	Open collector / drain output from power supply. Pull-up to VSB located in system.	
Input OK = High	The input Voltage meets the input range.	
Input OK = Lo	The input Voltage doesn't meet the input range.	
	MIN	MAX
Logic level low voltage, $I_{\text{sink}}=4\text{mA}$	0V	1.0V
Logic level high voltage, $I_{\text{sink}}=200\mu\text{A}$	2.0V	3.46V

6 Output Protection

6.1 Over Current Protection: (OCP)

This power supply has current limit to prevent the outputs from exceeding the values shown in table below. If the current limits are exceeded the power supply will shut down and latch off. The latch will be cleared by toggling the PSON# signal or by an AC power interruption. This power supply will not be damaged from repeated power cycling in this condition. +5VSB will be auto-recovered after removing OCP limit.

Output VOLTAGE	OVER CURRENT LIMITS
+12V	Peak current min; 110% of peak max
+5VSB	Min. 4A; Max. 6A.

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:12 of 21

6.2 Over Voltage Protection: (OVP)

This power supply over voltage protection will be locally sensed. This power supply will shutdown and latch off after an over voltage condition occurs. This latch will be cleared by toggling the PSON# signal or by an AC power interruption. The values are measured at the output of the power supply's connectors. The voltage will never exceed the maximum levels when measured at the power connectors of the power supply connector during any single point of fail. The voltage will never trip any lower than the minimum levels when measured at the power connector. +5VSB will be auto-recovered after removing OVP limit.

Output Voltage	MIN (V)	MAX (V)
+12V	13.3	14.5
+5VSB	5.7	6.5

6.3 Over Temperature Protection: (OTP)

This power supply will be protected against over temperature conditions caused by loss of fan cooling or excessive ambient temperature. In an OTP condition the PSU will shutdown. When the power supply temperature drops to within specified limits, this power supply will restore power automatically, while the +5VSB remains always on. The OTP circuit has built in margin such that the power supply will not oscillate on and off due to temperature recovering condition.

6.4 Short Circuit Protection: (SCP)

A short circuit placed on any DC output to DC return shall cause no damage. The power supply shall be latched in case any short circuit is taken place at +12V. The power supply shall be auto-recovered in case any short circuit is taken place at +5VSB.

7 Environment

7.1 Temperature and Humidity

Item	Description	MIN	MAX	Unit
T _{OP}	Operating temperature range	0	50	°C
T _{non-OP}	Non-Operating temperature range	-40	70	°C
T _{Δ_change}	Rate of temperature change		20	°C/hrs
H _{OP}	Operating humidity range, non condensing	20	85	%
H _{non-OP}	Non-Operating humidity range, non condensing	10	95	%

7.2 Altitude

Item	Description	MIN	MAX	Unit
A _{OP}	Operating Altitude range	0	5,000	m
A _{non-OP}	Non-Operating Altitude range	0	15,200	m

7.3 Random Vibration

Non-operating

Sine sweep

5Hz to 500Hz @ 0.5gRMS at 0.5 octave/min; dwell 15 min at each of 3 resonant points;

Random profile

5Hz @ 0.01g²/Hz to 20Hz @ 0.02g²/Hz (slope up); 20Hz to 500Hz @ 0.02g²/Hz (flat);

Input acceleration = 3.13gRMS; 10 min. per axis for 3 axis on all samples

7.4 Mechanical Shock

Operating: 5G, no malfunction

Non-operating: 50G, no damage. Trapezoidal Wave, Velocity change = 4.3m/sec. Three drops in each of six directions are applied to each of the samples

8 FRU Requirements

8.1 IPMI FRU Addressing

The PSU shall have an IPMI FRU (field replaceable unit). It shall be located at the following addresses.

This is intended to align with existing IPMI standards.

PSU IPMI FRU Device Address Locations

Addresses used:				
System addressing A1/ A0 ³	0/0	0/1	1/0	1/1
FRU device read/write addresses ²	A0h/A1h ¹	A2h/A3h	A4h/A5h	A6h/A7h

¹ Non-redundant power supplies will use the 0/0 address location.

² The addressing method uses the 7 MSB bits to set the address and the LSB to define whether a device is reading or writing. The addresses defined above use 8 bits including the read/write bit.

³ The '0' and '1' correspond to '1' = signal is not grounded; '0' = signal is grounded

8.2 FRU Data

The FRU data format shall be compliant with the IPMI ver.1.0 (per rev.1.1 from Sept.25, 1999) specification. The current version of these specifications is available at

<http://developer.intel.com/design/servers/ipmi/spec.htm>

The following is the exact listing of the EEPROM content. During testing this listing shall be followed and verified.

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:14 of 21

8.2 FRU Device Protocol

The FRU device will implement the same protocols as the commonly used AT24C02 device, including the Byte Read, Sequential Read, Byte Write, and Page Read protocols.

8.3 FRU Data Format

The information to be contained in the FRU device is shown in the following table.

Area Type	Description
Common Header	As defined by the FRU document
Internal Use Area	Not required, do not reserve
Chassis Info Area	Not applicable, do not reserve
Board Info Area	Not applicable, do not reserve
Product Info Area	As defined by the IPMI FRU document. Product information shall be defined as follows:
Field Name	Field Description
Manufacturer Name	Seasonic
Product Name	S1M-501SGP2
Product part/model number	S1M-501SGP2
Product Version	{Seasonic current revision, 3 digits}
Product Serial Number	{Defined at time of manufacture, 13 digits}
Asset Tag	{Not used, code is zero length byte}
FRU File ID	{Not required}
PAD Bytes	{Added as necessary to allow for 8-byte offset to next area}
Multi-Record Area	<p>As defined by the IPMI FRU document. The following record types shall be used on this power supply:</p> <p style="padding-left: 40px;">Power Supply Information (Record Type 0x00)</p> <p style="padding-left: 40px;">DC Output (Record Type 0x01)</p> <p>No other record types are required for the power supply.</p> <p>Multi-Record information shall be defined as follows:</p>
Field Name (PS Info)	Field Information Definition
Overall Capacity (watts)	500
Peak VA	500
Inrush current (A)	30
Inrush interval (msec)	5
Low end input voltage range 1	90
High end input voltage range 1	140

Low end input voltage range 2	180
High end input voltage range 2	264
A/C dropout total. (msec)	10
Binary flags	Set for: Hot Swap support, Auto switch, and PFC
Peak Wattage	550
Combined wattage	None
Predictive fail tach support	Supported
<u>Field Name</u> (Output)	<u>Field Description</u> : Two outputs are to be defined from #1 to #2, as follows: +12V and +5VSB.
Output Information	Set for: Standby on +5VSB, No Standby on all others.
All other output fields	Format per IPMI specification, using parameters in this specification.

9 Firmware Requirements

9.1 PMBus

9.1.1 Addressing

The PSU PMBus device address locations are shown below. For redundant systems there are up to two signals to set the address location of the PSU once it is installed in the system; Address1, Address0.

PSU PMBus Device Address Locations

Addresses used:				
System addressing A1/ A0 ³	0/0	0/1	1/0	1/1
PMBus device read / write addresses ²	B0h/B1h ¹	B2h/B3h	B4h/B5h	B6h/B7h

¹ Non-redundant power supplies will use the 0/0 address location

² The addressing method uses the 7 MSB bits to set the address and the LSB to define whether a device is reading or writing. The addresses defined above use 8 bits including the read/write bit.

³ The '0' and '1' correspond to '1' = signal is not grounded; '0' = signal is grounded

9.1.2 PMBus Commands

The following PMBus commands shall be supported for the purpose of monitoring currents, voltages, and power. All sensors shall continue providing real time data as long as the PMBus device is powered. This means in standby mode the main output(s) of the power supply shall be zero amps and zero volts.

Command Code	Command Name	SMBus Transaction Type	Number Of Data Bytes	Data Format	Remark
00h	PAGE	Read/Send Byte	1		
03h	CLEAR_FAULT	Send Byte	0

9.2 Sensors Accuracy

Sensor Functions	Accuracy 0-100% load	Accuracy 40-200W load	Accuracy 200W-Full load
READ_VIN	+/- 3%		
READ_IIN			+/- 5%
READ_PIN		+/- 10W	+/- 5%
READ_VOUT	+/- 3%		
READ_IOUT		+/- 1A	+/- 5%
READ_POUT		+/- 10W	+/- 5%
READ_TEMPERATURE	+/- 3 °C		
READ_FAN_SPEED	+/- 5 %		

9.3 Closed Loop System Throttling (CLST)

The power supply shall always assert the SMBAlert signal whenever any component in the power supply reaches a warning threshold. Upon reduction of the load within 2msec after the SMBAlert# signal is asserted if the load is reduced to less than the power supply rating; the power supply shall continue to operate and not shutdown.

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019
		Page:19 of 21

9.4 Smart Ride-Through (SmaRT)

The power supply shall assert the SMBAlert signal < 2msec after AC input voltage is lost to 0VAC.

10 MTBF

The power supply shall have a minimum MTBF at continuous operation of 100,000 hours calculated at 100% load, according to MIL-HDBK-217F at 25°C excluding the Fan MTBF, and at least 100,000 hours including the fan MTBF.

11 EMI

The power supply shall comply with FCC part 15, Subpart B and CE, EN55032+EN55024 Class A for both conducted and radiated emissions. Test shall be conducted using a shielded DC output cable to a shielded load. The load shall be adjusted to 100% load. Tests will be performed full load on each output power at 120VAC, 60Hz, and 230VAC, 50Hz.

12 Safety Compliance

- UL+cUL, UL 62368-1:2014
- TUV, EN62368-1:2014
- CB Certificate & Report, IEC60950-1 Edition 2, IEC62368-1:2014
- CCC(CQC China), GB4943-2011 Certification (China)

13 Mechanical

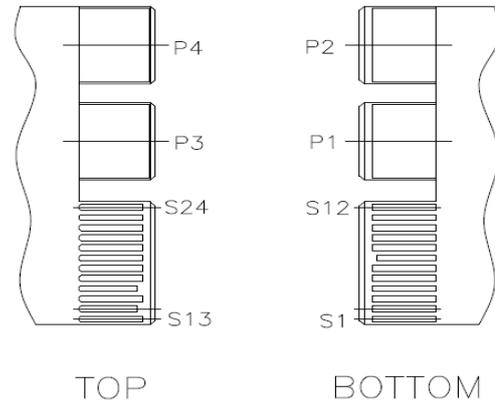

13.1 Dimension

Physical dimension: 165mm (D) x 50.5mm (W) x 40.2mm (H)

13.2 DC output connector

The power supply has a card edge for the DC outputs and signal pins, mating with Molex LPH series connector on the PDB side. DC output pin definitions shown as below table.

Pin#	Signal Name	Function
S1	+12VRS+	+12V remote sense
S2	+12VRS-	+12V RTN sense
S3	12V LS	Current share bus
S4	SMB ALERT	Failure notification
S5	SDA	I ² C Data signal
S6	SCL	I ² C Clock signal
S7	PSKILL	PSU off signal
S8	PSON	Power enable input
S9	PWOK	Power output
S10	A1	I ² C address bit 1
S11	+5Vsb	+5Vsb output
S12	+5Vsb	+5Vsb output
S13	N/A	N/A
S14	PRESENT	PSU present
S15	A0	I ² C address bit 0
S16	N/A	N/A
S17	N/A	N/A
S18	N/A	N/A
S19	INPUT OK	Input present signal
S20	N/A	N/A
S21	CR_BUS	Cold Redundancy Bus
S22	N/A	N/A
S23	+5Vsb	+5Vsb output
S24	+5Vsb	+5Vsb output
P1	+12V	+12V
P2	+12V	+12V
P3	SGND	GND
P4	SGND	GND

TOP

BOTTOM

14 Redundant Function

14.1 Hot Swap Requirements

Hot Swapping a power supply is the process of inserting and extracting a power supply from an operating power system. During this process the output voltages shall remain within the limits with the capacitive load specified. The hot swap test must be conducted when the system is operating under static, dynamic and zero loading conditions. The power supply can be hot swapped by the following method:

 SWITCHING POWER SUPPLY	PRODUCT SPECIFICATION	File: 500Slim-1U-A0D
	Model: S1M-501SGP2 (PMBus) Rev.:A0.D	Date: Nov 20, 2019 Page:21 of 21

Extraction: The power supply may be removed from the system while operating with PSON# asserted, while in standby mode with PSON# de-asserted or with no AC applied. No connector damage should occur during un-mating of the power supply from the power distribution board (PDB).

Insertion: The power supply may be inserted into the system with PSON# asserted, with PSON# de-asserted or with no AC power present for that supply. No connector damage should occur due to the mating of the output and input connector.

In general a failed (of by internal latch or external control) supply may be removed, then replaced with a good power supply, however, hot swap needs to work with operational as well as failed power supplies. The newly inserted power supply will get turned on into standby or Power On mode once inserted.

14.2 LED Indicators

The power supply uses a bi-color LED; Amber & Green. Below are table showing the LED states for power supply operating state.

Power Supply Condition	LED State
Output ON and OK	GREEN
No AC power to all power supplies	OFF
PSU standby state AC present / Only Standby on	1Hz Blink GREEN
Power supply critical event causing a shutdown; failure, over current, short circuit, over voltage, fan failure, over temperature	AMBER

15 Fan and Fan Speed Control

This power supply incorporates a 40mm fan for cooling the power supply. When installed in the system, the airflow direction shall be from the card edge connector side to the AC inlet side of the power supply.

The fan speed control has close loop algorithm based on both the critical component temperature and the ambient temperature (Inlet temperature). The PSU fan always ramps to maximum speed under any condition to protect the power supply from overheating and the acoustic level will be >57dBA. These conditions include high ambient temperatures, loading, AC input, and airflow impedance.
